

## Cropping an image for projection using Elements

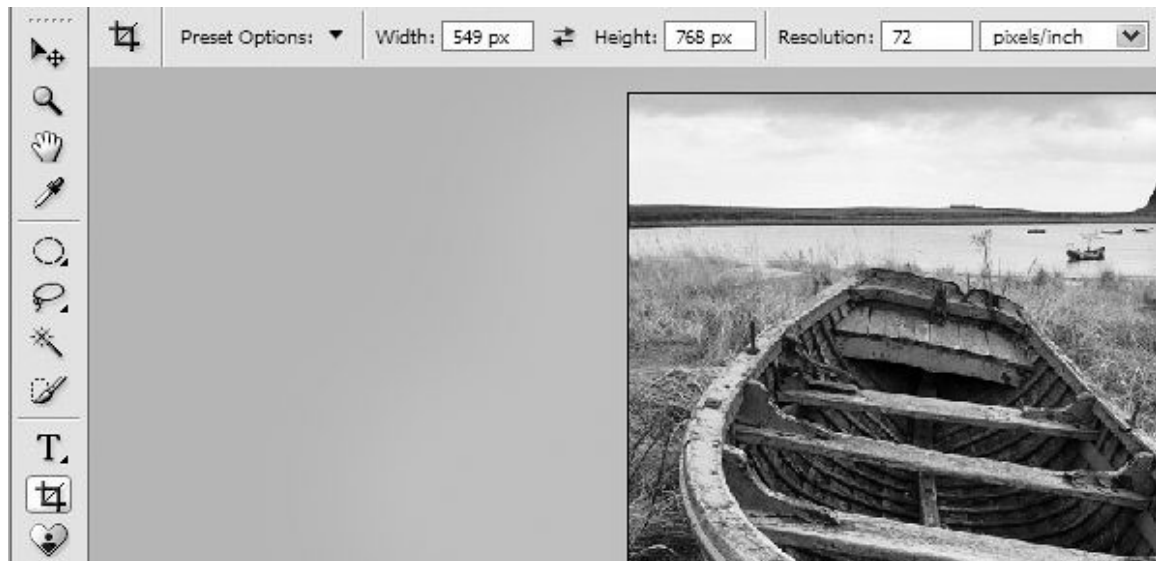

### Landscape format image

When the image is open choose the crop tool and enter the pixel dimensions as shown below, I suggest pixel dimensions of 1004 X 748 at 72dpi for a landscape format image. This gives a small black border around the image when it is projected.

### Portrait format image

Choose the crop tool again, but this time enter 549 width X 768 height at 72dpi.

Don't forget to check the sharpness of the image after the crop and it may be beneficial to increase the saturation of colour images to get the 'velvia' look.
